

RADIATOR STOP LEAK

Code: TQ017

DESCRIPTION

Radiator Stop Leak is a specially formulated liquid designed to provide temporary repair of radiator leaks and seepage from radiator hoses and gaskets, and to reduce the loss of coolant from the cooling system. Radiator Stop Leak contains lubricating heat-sensitive synthetic polymers and is free from abrasive mineral fibres.

FEATURES

- Ideal as a temporary repair to cooling system when emergency situations occur.
- Seals leaks in radiator units, both cast iron and alloy cylinder heads, engine blocks and heater units.
- Use in conjunction with Anti-freeze / Anti-boil to prevent seepage common with this product. Acts as a lubricant for water pumps.

APPLICATIONS

Prior to adding to cooling system, ensure engine is at normal operating temperature, the heater tap is on, and that the thermostat is open. Once established, add about 250 ml Radiator Stop Leak slowly to the cooling system. Ensure adequate coolant is present. NOTE: Shake bottle well for the best results, do not spill on paintwork, and avoid contact with skin and eyes.

Drain and flush the cooling system thoroughly when permanent repairs to leaks are undertaken, and refill with appropriate type and amount of Anti-freeze / Anti-boil coolant.
